Bors (j/w Wang) (Carleton)

Cycle types of complete mappings

Definition

(G, +): group, n.n. abelian.

э

< □ > < □ > < □ > < □ > < □ > < □ >

4 3 5 4 3 5 5

Definition

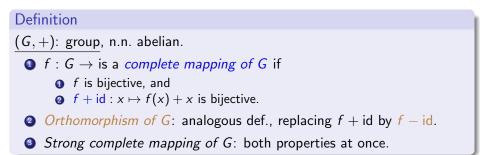

- (G, +): group, n.n. abelian.
 - $f: G \rightarrow is a complete mapping of G if$
 - f is bijective, and
 - 2 $f + id : x \mapsto f(x) + x$ is bijective.
 - **2** Orthomorphism of G: analogous def., replacing f + id by f id.

4 1 1 4 1 1 1

Definition

- (G, +): group, n.n. abelian.
 - $f: G \rightarrow is a complete mapping of G if$
 - f is bijective, and
 - 2 $f + id : x \mapsto f(x) + x$ is bijective.
 - **2** Orthomorphism of G: analogous def., replacing f + id by f id.
 - Strong complete mapping of G: both properties at once.

4 1 1 1 4 1 1 1

f is complete mapping \Leftrightarrow f + id is orthomorphism.

1 negative results: necessary conditions, allowing to refute cycle types;

.

Question

What can be said about the cycle types of complete mappings of a finite group (field)?

Two ways of "saying something":

- **1** negative results: necessary conditions, allowing to refute cycle types;
- e positive results: give examples of possible cycle types (and corr. complete mappings).

< □ > < 同 > < 三 > < 三 >

• Only these elementary results are known:

- Only these elementary results are known:
 - G: abelian group, f: compl. map. of G. Then f has no 2-cycle (x, f(x)).

• Only these elementary results are known:

• <u>*G*: abelian group, f: compl. map. of *G*. Then *f* has no 2-cycle (x, f(x)). Otherwise,</u>

$$(f+id)(x) = f(x)+x = f(x)+f(f(x)) = f(f(x))+f(x) = (f+id)(f(x)),$$

4 1 1 4 1 1 1

• Only these elementary results are known:

• <u>*G*: abelian group, f: compl. map. of *G*. Then *f* has no 2-cycle (x, f(x)). Otherwise,</u>

$$(f+id)(x) = f(x)+x = f(x)+f(f(x)) = f(f(x))+f(x) = (f+id)(f(x)),$$

contradiction as f + id is injective.

• Only these elementary results are known:

• G: abelian group, f: compl. map. of G. Then f has no 2-cycle $\overline{(x, f(x))}$. Otherwise,

$$(f+id)(x) = f(x)+x = f(x)+f(f(x)) = f(f(x))+f(x) = (f+id)(f(x)),$$

contradiction as f + id is injective.

G: group, <u>f: orthomor. of G</u>. Then f has exactly 1 fixed point,

4 1 1 4 1 1 1

• Only these elementary results are known:

• G: abelian group, f: compl. map. of G. Then f has no 2-cycle $\overline{(x, f(x))}$. Otherwise,

$$(f+id)(x) = f(x)+x = f(x)+f(f(x)) = f(f(x))+f(x) = (f+id)(f(x)),$$

contradiction as f + id is injective.

2 <u>G: group</u>, <u>f: orthomor. of G</u>. Then f has exactly 1 fixed point, because f(x) = x is equ. to $x = (f - id)^{-1}(0_G)$.

(人間) とうきょうきょう

• Only these elementary results are known:

• G: abelian group, f: compl. map. of G. Then f has no 2-cycle $\overline{(x, f(x))}$. Otherwise,

$$(f+id)(x) = f(x)+x = f(x)+f(f(x)) = f(f(x))+f(x) = (f+id)(f(x)),$$

contradiction as f + id is injective.

- 2 <u>G: group</u>, <u>f: orthomor. of G</u>. Then f has exactly 1 fixed point, because f(x) = x is equ. to $x = (f - id)^{-1}(0_G)$.
- If $x + x = 0_G$ for all $x \in G$, then f is compl. map. of $G \Leftrightarrow f$ is orthomor. of G.

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* 25: 306–315, 2014. Theorem 9.

• Regular complete mappings:

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* **25**: 306–315, 2014. Theorem 9.

• Regular complete mappings:

• <u>K: fin. field</u>, $a \in K$, $a \neq 0, -1$. Then $x \mapsto ax$ is a compl. map. of K.

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* 25: 306–315, 2014. Theorem 9.

- Regular complete mappings:
 - <u>K</u>: fin. field, $a \in K$, $a \neq 0, -1$. Then $x \mapsto ax$ is a compl. map. of K.
 - It has 1 fixed point (0_K) and $\frac{|K|-1}{\ell}$ cycles of length $\ell = \operatorname{ord}_{K^*}(a)$.

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* **25**: 306–315, 2014. Theorem 9.

- Regular complete mappings:
 - <u>K: fin. field</u>, $a \in K$, $a \neq 0, -1$. Then $x \mapsto ax$ is a compl. map. of K.
 - ▶ It has 1 fixed point (0_K) and $\frac{|K|-1}{\ell}$ cycles of length $\ell = \operatorname{ord}_{K^*}(a)$.
 - Permutations with such a cycle type are called ℓ -regular.

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* **25**: 306–315, 2014. Theorem 9.

- Regular complete mappings:
 - <u>K: fin. field</u>, $a \in K$, $a \neq 0, -1$. Then $x \mapsto ax$ is a compl. map. of K.
 - It has 1 fixed point (0_{κ}) and $\frac{|\kappa|-1}{\ell}$ cycles of length $\ell = \operatorname{ord}_{\kappa^*}(a)$.
 - Permutations with such a cycle type are called ℓ -regular.
 - ► Focus so far mostly on constructing other examples of *l*-regular complete mappings, see e.g. [17], [18], [23] and [35].

⁹A. Muratović-Ribić and E. Pasalic, A note on complete polynomials over finite fields and their applications in crpytography, *Finite Fields Appl.* **25**: 306–315, 2014. Theorem 9.

② If $\ell \ge 2$: $M(d, p, \ell) = AGL_d(p)$ unless $(d, p) \in \{(1, 2), (1, 3), (2, 2)\}$.

25 / 34

Our case: $K = \mathbb{F}_p$, σ and each A_u arbitrary compl. map.

Question

For given ℓ , which elements of $\operatorname{Aff}_{\mathbb{F}_p}(\mathbb{F}_p^d) = \operatorname{AGL}_d(p)$ are a product of ℓ compl. map. in $\operatorname{AGL}_d(p)$?

Proposition

 $\frac{d, \ell \in \mathbb{N}^{+}}{M(d, p, \ell)}, \frac{p \text{ prime.}}{\text{ set of products of } \ell \text{ compl. map. in } AGL_{d}(p)}. \text{ Then}$ $M(d, p, 1) = \{\lambda(M, v) : M \in CGL_{d}(p), v \in \mathbb{F}_{p}^{d}\}.$ $M(d, p, 1) = \{\lambda(M, v) : M \in CGL_{d}(p), v \in \mathbb{F}_{p}^{d}\}.$ $If \ \ell \ge 2: \ M(d, p, \ell) = AGL_{d}(p) \text{ unless } (d, p) \in \{(1, 2), (1, 3), (2, 2)\}.$ $If \ \ell \ge 2, \ (d, p) = (1, 2): \ M(d, p, \ell) = \emptyset.$ $If \ \ell \ge 2, \ (d, p) = (1, 3): \ M(d, p, \ell) = \{(1)\}.$ $If \ \ell \ge 2, \ (d, p) = (2, 2): \ M(d, p, \ell) = \langle \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix} \rangle.$

Concluding the proof of Theorem 4

Bors (j/w Wang) (Carleton)
