## Outline:

- A class of permutation polynomials
- Factorization, degrees of irreducible factors

- Sequences of permutation polynomials
- Number theoretic properties

We study a class of permutation polynomials  $F_n$  of  $\mathbb{F}_q$ , which are defined recursively as

$$F_0(x) = a_0 x + a_1 \in \mathbb{F}_q[x], a_0 \neq 0$$
 and  
 $F_n(x) = F_{n-1}(x)^{q-2} + a_{n+1}, \ n \ge 1, \ a_{n+1} \in \mathbb{F}_q.$ 

Recall that the set of permutation polynomials over  $\mathbb{F}_q$  of degree < q forms a group  $\mathbf{G}_P$  under composition modulo  $x^q - x$ . The group  $\mathbf{G}_P$  is generated by the linear polynomials ax + b for  $a, b \in \mathbb{F}_q$ ,  $a \neq 0$  and  $x^{q-2}$ , (L. Carlitz, 1953).

In other words, any permutation  $\sigma$  of  $\mathbb{F}_q$ , can be represented by

$$F_n(x) = F_{n-1}(x)^{q-2} + a_{n+1}, \ n \ge 1, \ a_{n+1} \in \mathbb{F}_q$$
 for some  $n \ge 0$ , with  
 $F_0(x) = a_0 x + a_1 \in \mathbb{F}_q[x], a_0 \ne 0,$ 

i.e., there is a polynomial

$$F_n(x) = (\dots ((a_0x + a_1)^{q-2} + a_2)^{q-2} \dots + a_n)^{q-2} + a_{n+1}$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

satisfying  $\sigma(c) = F_n(c)$  for all  $c \in \mathbb{F}_q$ , where  $n \ge 0$ ,  $a_1, a_{n+1} \in \mathbb{F}_q$ ,  $a_i \in \mathbb{F}_q^*$  for i = 0, 2, ..., n.

$$F_n(x) = (\dots ((a_0x + a_1)^{q-2} + a_2)^{q-2} \dots + a_n)^{q-2} + a_{n+1}$$

The polynomial  $F_n(x)$  can be approximated by rational fractions in the following sense. The rational fraction

$$R_n(x) = \frac{\alpha_{n+1}x + \beta_{n+1}}{\alpha_n x + \beta_n},$$

with

$$\alpha_{n+2} = \mathbf{a}_{n+2}\alpha_{n+1} + \alpha_n, \ \beta_{n+2} = \mathbf{a}_{n+2}\beta_{n+1} + \beta_n$$

for  $n \ge 0$  with  $\alpha_0 = 0, \alpha_1 = a_0, \beta_0 = 1, \beta_1 = a_1$ ,

satisfies

$$F_n(c) = R_n(c)$$
, for all  $c \in \mathbb{F}_q \setminus S_n$ ,

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

where the cardinality of  $S_n$  is at most n.

#### Question. Consider

$$F_n(x) = (\dots ((ax + a_1)^{q-2} + a_2)^{q-2} \dots + a_n)^{q-2} + a_{n+1} \in \mathbb{F}_q[x]$$

of degree  $(q-2)^n$ . What can one say about the irreducible factors?

Example:

Let 
$$F_2(x) = (x^{27} + 3)^{27} - 2 \in \mathbb{F}_{29}[x]$$
.

 $\begin{aligned} F_2(x) &= (x+12) \left( x^2 + 17x - 1 \right) \left( x^{6} + 2x^3 - 1 \right) \left( x^{18} + x^9 - 1 \right) \left( x^{54} + 2x^{27} + 18 \right) \\ \left( x^{162} + 18x^{135} + 19x^{108} + 9x^{54} + 15x^{27} + 16 \right) &\left( x^{486} + 25x^{459} + 14x^{432} + 21x^{405} + 26x^{378} + 27x^{351} + 16x^{324} + 16x^{297} + 8x^{270} + 14x + 243 + 20x^{216} + 5x^{189} + 17x^{162} + 21x^{135} + 3x^{108} + 24x^{81} + 24x^{54} + 21x^{27} + 10 \right) \end{aligned}$ 

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Let  $n \geq 1$  and  $a_1, \ldots, a_n \in \mathbb{F}_q$ . Suppose that the integers  $d_1, \ldots, d_n$  satisfy

$$d_i \ge 2$$
 and  $\gcd(d_i,q) = \gcd(d_i,q-1) = 1$  for  $1 \le i \le n$ .  
Put  $F_0(x) = x$  and  $F_i(x) = F_{i-1}(x)^{d_i} + a_i$ 

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Aim: Determine the degrees of the irreducible factors.

Let Q(x) be an irreducible factor of  $F_n(x)$  of deg Q(x) > 1.

Put  $K = \mathbb{F}_q$ , choose a root  $\lambda \in \overline{K}$  of the polynomial  $Q(x) \Longrightarrow$ deg  $Q(x) = [K(\lambda) : K]$ .

Define

$$\lambda_i = F_i(\lambda) = F_{i-1}(\lambda)^{d_i} + a_i$$
 for  $i = 0, \dots, n$ .

Hence

$$\lambda_0 = F_0(\lambda) = \lambda,$$
  
$$\lambda_i = \lambda_{i-1}^{d_i} + a_i, \ 1 \le i \le n - 1,$$
  
$$\lambda_n = F_n(\lambda) = 0.$$

Consider

$$\mathbb{F}_q = \mathbb{F}_q(\lambda_n) = \mathcal{K}(\lambda_n) \subseteq \mathcal{K}(\lambda_{n-1}) \subseteq \ldots \subseteq \mathcal{K}(\lambda_1) \subseteq \mathcal{K}(\lambda_0) = \mathcal{K}(\lambda).$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Let  $d = \text{lcm}(d_1, \ldots, d_n)$ , and  $L = K(\omega)$ , where  $\omega \in \overline{K}$  is a primitive *d*-th root of unity.

Put  $M = L \cap K(\lambda)$  and let  $L(\lambda) = L \cdot K(\lambda)$ .

Theorem: Let

$$F_0(x) = x$$
 and  $F_i(x) = F_{i-1}(x)^{d_i} + a_i$ ,

with  $a_i \in \mathbb{F}_q$ ,  $d_i \geq 2$ , and

$$\gcd(d_i,q) = \gcd(d_i,q-1) = 1$$
 for  $1 \le i \le n$ .

Put  $d = \text{lcm}(d_1, \ldots, d_n)$ . Suppose that  $Q(x) \in \mathbb{F}_q[x]$  is an irreducible factor of  $F_n(x)$ . Then,

 $\deg Q(x) \mid d_1 \cdot d_2 \cdot \ldots \cdot d_{n-1} \cdot \operatorname{ord}_d(q).$ 

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

$$\deg Q(x) \mid d_1 \cdot d_2 \cdot \ldots \cdot d_{n-1} \cdot \operatorname{ord}_d(q).$$

Let 
$$F_2(x) = (x^{27} + 3)^{27} - 2 \in \mathbb{F}_{29}[x].$$
  
 $d = d_1 = d_2 = 27, \ ord_{27}(29) = 18.$ 

Degrees of the irreducible factors are:  $1, 2, 6, 18, 54, 162, 486 = 18 \cdot 27$ .

< ロト < 団ト < 三ト < 三ト < 三 ・ つへの</li>

Theorem: Let

$$F_0(x) = x$$
 and  $F_i(x) = F_{i-1}(x)^{d_i} + a_i$ ,

with  $a_i \in \mathbb{F}_q$ ,  $d_i \geq 2$ , and

$$\gcd(d_i,q) = \gcd(d_i,q-1) = 1$$
 for  $1 \leq i \leq n$ .

Put  $d = \text{lcm}(d_1, \ldots, d_n)$ . Suppose that  $Q(x) \in \mathbb{F}_q[x]$  is an irreducible factor of  $F_n(x)$ . Then,

(i) deg  $Q(x) \mid d_1 \cdot d_2 \cdot \ldots \cdot d_{n-1} \cdot \operatorname{ord}_d(q)$ .

(ii) Suppose deg Q(x) > 1. Then there exists some  $j \in \{1, 2, ..., n\}$  and a prime number  $\ell \mid d_i$  such that  $\operatorname{ord}_{\ell}(q) \mid \deg Q(x)$ .

Example: Let  $F_2(x) = (x^{27} + 3)^{27} - 2 \in \mathbb{F}_{29}[x]$ .  $d = d_1 = d_2 = 3^3$ ,  $ord_3(29) = 2$ . Degrees of the irreducible factors are: 1, 2, 6, 18, 54, 162, 486.

Let 
$$A = (a_1, ..., a_n) \in \mathbb{F}_q^n$$
 and  $D = (d_1, ..., d_n) \in \mathbb{Z}^n$ , where  
 $d_i \ge 2$  and  $gcd(d_i, q) = gcd(d_i, q - 1) = 1, \ 1 \le i \le n$ .  
 $F_n^{(A,D)} := F_n(x) = (...(x^{d_1} + a_1)^{d_2} ... + a_n)^{d_n} + a_n$ .

We introduce the sets

$$\begin{split} \Delta_n^{(A,D)} &:= \{ \deg Q(x) \mid Q(x) \text{ is an irreducible factor of } F_n^{(A,D)}(x) \}, \\ \bar{\Delta}_n^{(D)} &:= \bigcup_{A \in \mathbb{F}_q^n} \Delta_n^{(A,D)}. \end{split}$$

 $\Delta_n^{(D)} := \{k > 1 \mid k \text{ divides } d_1 d_2 \cdots d_{n-1} \cdot \operatorname{ord}_d(q), \text{and } k \text{ is divisible} \\ \text{by } \operatorname{ord}_\ell(q) \text{ for some prime divisor } \ell \text{ of } d\} \cup \{1\},$

 $\Longrightarrow \bar{\Delta}_n^{(D)} \subseteq \Delta_n^{(D)}.$ 

Question: How are these sets related?

 $\Delta_n^{(A,D)} = \{ \deg Q(x) \mid Q(x) \text{ is an irreducible factor of } F_n^{(A,D)}(x) \},$  $\bar{\Delta}^{(D)} = \left| \begin{array}{c} \Delta^{(A,D)} \\ \Delta^{(A,D)} \end{array} \right|.$ 

$$\Delta_n^{(D)} = \bigcup_{A \in \mathbb{F}_q^n} \Delta_n^{(A,D)}$$

 $\Delta_n^{(D)} = \{k > 1 \mid k \text{ divides } d_1 d_2 \cdots d_{n-1} \cdot \operatorname{ord}_d(q), \text{and } k \text{ is divisible} \\ \text{by } \operatorname{ord}_\ell(q) \text{ for some prime divisor } \ell \text{ of } d\} \cup \{1\},$ 

Theorem: Let *m* be any divisor of  $d_1$ . Then  $\operatorname{ord}_m(q) \in \overline{\Delta}_n^{(D)}$ . Moreover,  $\operatorname{ord}_m(q) \in \Delta_n^{(A,D)}$  for any  $A \in \mathbb{F}_q^n$ , satisfying  $F_n^{(A,D)}(0) \neq 0$ .

$$\Delta_n^{(A,D)} = \{ \deg Q(x) \mid Q(x) \text{ is an irreducible factor of } F_n^{(A,D)}(x) \}.$$

Theorem: Let  $A \in \mathbb{F}_q^n$  be arbitrary. Suppose  $F_n^{(A,D)}$  has an irreducible factor Q(x) of degree r > 1. Then  $F_n^{(A,D)}$  has an irreducible factor R(x) also with deg R(x) = t, where

$$t=\frac{\operatorname{lcm}(r,\operatorname{ord}_m(q))}{f},$$

*m* is a divisor of  $d_1$  and *f* is a divisor of  $gcd(r, ord_m(q))$ . In other words, if  $r \in \Delta_n^{(A,D)}$ , then  $t \in \Delta_n^{(A,D)}$ . Problem: If  $\bar{\Delta}_n^{(D)} \cong \Delta_n^{(D)}$ , determine  $\Delta_n^{(D)} \setminus \bar{\Delta}_n^{(D)}$ , i.e., eliminate the degrees in  $\Delta_n^{(D)}$ , which are not in  $\bar{\Delta}_n^{(D)}$  (and hence find  $\bar{\Delta}_n^{(D)}$ ).

Theorem: Suppose that  $d = \operatorname{lcm}(d_1, \ldots, d_n) = \ell \cdot e$ , where  $\ell$  is a prime number and  $\ell \nmid e \cdot \operatorname{ord}_e(q)$ . Let *m* be an integer with  $\operatorname{ord}_\ell(q) \nmid m$ . Then  $m \cdot \ell \notin \Delta_n^{(A,D)}$  for any  $A \in \mathbb{F}_q^n$ .

Example:

Let q = 683, D = (45, 15). Then,

 $\Delta_2^{(D)} = \{1, 2, 4, 6, {\color{black}10}, 12, 18, 20, {\color{black}30}, 60, {\color{black}90}, 180, \}.$ 

The degrees 10, 30, 90, can be eliminated to yield

 $S := \{1, 2, 4, 6, 12, 18, 20, 36, 60, 108\}.$

Indeed,  $\bar{\Delta}_2^{(D)} = S$ .

Let q = 59, D = (357, 357). Then  $\Delta_2^{(D)} = \{1, 2, 4, 6, 8, 12, 14, 18, 24, 28, 34, 36, 42, 56, 68, 72, 84, 102, 126, 136, 168, 204, 238, 252, 306, 408, 476, 504, 612, 714, 952, 1224, 1428, 2142, 2856, 4284, 8568\}.$ 

・ロト・西ト・ヨト・ヨー シック

 $\implies$ 

Let q = 59, D = (357, 357). Then  $\Delta_2^{(D)} = \{1, 2, 4, 6, 8, 12, 14, 18, 24, 28, 34, 36, 42, 56, 68, 72, 84, 102, 126, 136, 168, 204, 238, 252, 306, 408, 476, 504, 612, 714, 952, 1224, 1428, 2142, 2856, 4284, 8568\}.$ 

$$\begin{split} \bar{\Delta}_2^{(D)} &= \{1,2,6,8,18,24,42,72,126,136,168,408,504,1224,2856,8568\}.\\ \text{If } A &= (1,45)\text{, then } \Delta_2^{(A,D)} = \bar{\Delta}_2^{(D)}\text{, while } \deg(F_2^{(A,D)}) = 127449\text{, and}\\ w(F_2^{(A,D)}) &= 13507. \end{split}$$

(日)(1)<p

Let 
$$q = 317$$
,  $D = (3, 5, 13)$ . Then,  
 $\Delta_n^{(D)} = \{1, 2, 4, 6, 10, 12, 20, 30, 60\}.$   
Let  $A = (19, 128, 254)$ . One can eliminate 6, 10, 30 to find  
 $\Delta_3^{(A,D)} = \{1, 2, 4, 12, 20, 60\}.$ 

The polynomial  $F_n^{(A,D)}$  is of degree 195 and weight 196.

Let  $A = \{a_i\}_{i \ge 1}$  be a sequence over  $\mathbb{F}_q^*$  and  $D = \{d_i\}_{i \ge 1}$  be a sequence in  $\mathbb{Z}$ , satisfying

$$d_i \geq 2$$
 and  $\gcd(d_i, q) = \gcd(d_i, q-1) = 1.$ 

Consider the sequence  $\mathcal{F} = \mathcal{F}^{(A,D)} = \{F_i^{(A,D)}(x)\}_{i\geq 0}$ , of permutation polynomials associated to the sequences A and D, which we define

recursively by

$$F_0(x)=x+a_1$$
 and  $F_i(x)=F_{i-1}(x)^{d_i}+a_{i+1}$  for  $i\geq 1$ .

## Questions:

- Find upper/lower bounds for the largest degree  $\mathcal{D}(F_n)$  of irreducible factors of the n'th term of the sequence  $\mathcal{F}$ ,
- Find upper/lower bounds for the number  $\nu(F_n)$  of irreducible factors of the n'th term of the sequence  $\mathcal{F}$ .

Let  $F_n = \prod_{Q \in irr(F_n)} Q^{e_{n,Q}}$ , where  $irr(F_n)$  denotes the set of all irreducible factors of  $F_n$ .

- ▶ Find upper/lower bounds for the multiplicities e<sub>n,Q</sub>, when Q(x) ranges over irr(F<sub>n</sub>).
- Find upper/lower bounds for  $\sum_{Q \in irr(F_n)} e_{n,Q}$ .
- ► Given q, D, N. Can one construct a sequence  $\mathcal{F}$  over  $\mathbb{F}_q$  of N terms, such that  $F_1, F_2, \ldots, F_N$  are pairwise relatively prime?

(日)((1))

Theorem: Let  $\mathcal{D}(F_n)$  be the largest degree of irreducible factors of the nth term  $F_n$  of the sequence  $\mathcal{F}$ . Then,

$$\operatorname{ord}_{d_n}(q) \leq \mathcal{D}(F_n) \leq d_1 \cdot d_2 \cdot \ldots \cdot d_{n-1} \cdot \operatorname{ord}_{d_n}(q).$$

A polynomial is m-smooth if the degrees of its irreducible factors are all at most m.

Recall that

$$\mathcal{D}(F_n) \leq d_1 \cdot d_2 \cdot \ldots \cdot d_{n-1} \cdot \operatorname{ord}_{d_n}(q).$$

Corollary: Let  $m = d_1 \cdot d_2 \cdots d_{n-1} \cdot \operatorname{ord}_{d_n}(q)$ , then  $F_n^{(A,D)}$  is *m*-smooth for any *A*.

Examples:

Let  $q = 2^7$ , n = 4,  $d_1 = d_2 = d_3 = 3$ ,  $d_4 = 129$ . Then  $\operatorname{ord}_{d_4}(q) = 2$ ,  $\operatorname{deg}(F_4(x)) = 3483$  and m = 54.

Let q = 289, D = (5, 5, 5, 145). Then  $\operatorname{ord}_{d_4}(q) = 2$ ,  $\operatorname{deg}(F_4(x)) = 18125$  and m = 250.

 $\rho(m) :=$  number of irreducible factors of  $(T^m - 1)$  over  $\mathbb{F}_q$ .

Theorem: Let  $\nu(F_n)$  be the number of irreducible factors of the polynomial  $F_n$ . Then,

(i) 
$$\nu(F_n) \ge \rho(d_n)$$
 for all  $n \ge 1$ . If  $F_n(-a_1) \ne 0$  then  $\nu(F_n) \ge \rho(d_1)$ .

(ii) For any q > 2 and any fixed  $n \ge 1$ , there is a sequence  $A = \{a_i\}_{i\ge 1}$ in  $\mathbb{F}_q^*$  such that

$$u(F_n^{(A,D)}) \ge \rho(d_1) + \sum_{i=2}^n (\rho(d_i) - 1) \ge n + 1.$$

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬぐ

Method:

Let  $0 \le i < j \le n$ . We define auxiliary polynomials  $H_{i,j} \in \mathbb{F}_q[\mathcal{T}]$  as follows.

$$\begin{aligned} H_{j-1,j}(T) &= T + a_{j+1}, \\ H_{i,j}(T) &= (\dots ((T + a_{i+2})^{d_{i+2}} + a_{i+3})^{d_{i+3}} + \dots + a_j)^{d_j} + a_{j+1} \text{ for } i \leq j-2, \\ \implies \\ F_j &= H_{i,j}(F_i^{d_{i+1}}) \text{ for } 0 \leq i < j \leq n. \\ H_{i,k}(T) &= H_{j,k}(H_{i,j}(T)^{d_{j+1}}) \text{ for } 0 \leq i < j < k \leq n. \\ H_{i,j}(T) &= H_{i,j-1}(T)^{d_j} + a_{j+1} \text{ for } 0 \leq i \leq j-1 < n. \end{aligned}$$

Lemma: The following hold for  $0 \le i < j \le n$ . (i)  $gcd(F_i, F_j) = 1$  if and only if  $H_{i,j}(0) \ne 0$ . (ii) If  $gcd(F_i, F_j) \ne 1$ , then  $F_i^{d_{i+1}} | F_j$ . Theorem: Let  $J \subseteq \{0, 1, ..., N\}$  and |J| > q. Then there exist  $i, j \in J$  with i < j such that  $gcd(F_i, F_j) \neq 1$  (and hence  $F_i^{d_{i+1}} | F_j$ ).

Theorem: For all *n* with  $1 \le n \le q-1$  and for all *n*-tuples  $(a_1, \ldots, a_n) \in (\mathbb{F}_q^*)^n$ , there exists an element  $a_{n+1} \in \mathbb{F}_q^*$  such that  $gcd(F_i, F_n) = 1$  for all i = 0, ..., n-1.

Corollary: For all *n* with  $1 \le n \le q - 1$  and for all *n*-tuples  $(a_1, \ldots, a_n) \in (\mathbb{F}_q^*)^n$ , one can choose an element  $a_{n+1} \in \mathbb{F}_q^*$  such that all polynomials  $F_0^{(A,D)}, \ldots, F_n^{(A,D)}$  are squarefree, where  $A = \{a_n\}_{n \ge 1}$ .

Theorem: Let  $Q \in \mathbb{F}_q[x]$  be an irreducible factor of  $F_n$ , and  $e_{n,Q}$  be the multiplicity of Q in  $F_n$ . Put  $I_{n,Q} = \{i : Q \mid F_i, 0 \le i < n\}$ . Then, either

$$e_{n,Q}=1$$
 or  $e_{n,Q}=\prod_{i\in I_{n,Q}}d_{i+1}.$ 

Theorem: Let  $d_i = d$  for all  $i \ge 1$ , and

$$e_n = \max\{e_{n,Q} : Q \in \operatorname{irr}(F_n)\}.$$

・ロト ・ 目 ・ ・ ヨト ・ ヨ ・ うへつ

Then  $e_n \leq d^{\frac{n}{2}}$ , if *n* is even, and  $e_n \leq d^{\frac{n-1}{2}}$ , if *n* is odd.

Let  $G = \{G_n(x)\}_{n\geq 1}$  be a sequence in  $\mathbb{F}_q[x]$ . An irreducible polynomial Q(x) is called a primitive irreducible divisor of  $G_n$ ,  $n \geq 2$ , if  $Q \mid G_n$  and  $gcd(Q, G_i) = 1$ , for any  $1 \leq i < n$ .

Theorem: Every term  $F_n$  of the sequence  $\mathcal{F}$  has a primitive irreducible divisor.

## **Open Problems:**

- Suppose deg F<sub>n</sub> = d<sub>1</sub> ··· d<sub>n</sub> < q, and σ is the permutation induced by F<sub>n</sub>. Is there a relation between the factorization pattern of F<sub>n</sub> and properties of σ?
- Find conditions on A, such that  $\Delta_n^{(A,D)} = \overline{\Delta}_n^{(D)}$ .
- Construct sequences of length N, N ≥ 1, such that all the irreducible factors of F<sup>(A,D)</sup><sub>i</sub>, ..., F<sup>(A,D)</sup><sub>i+N</sub>, i ≥ 1, are of the same degree or of distinct degrees (except for the factor of degree 1).

For details of proofs and references see "Permutation polynomials and factorization" by T. Kalaycı, H. Stichtenoth and A. Topuzoğlu, which appeared in Cryptography and Communications; https://doi.org/10.1007/s12095-020-00446-y
